PRISM DATA MANAGEMENT JOURNEY MAP

Nina

" My job is to help solve end users' problems while understanding the limits of the system. It's important to me that the solutions I create are easy to use and are useful."

Example Job Titles

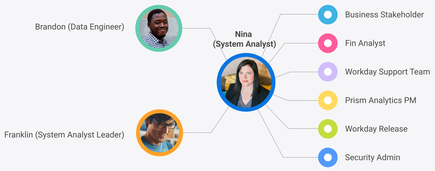
- HRIS/HRIT Analyst
- Financial Systems Analyst
- IT Analyst
- Systems Analyst

Main Responsibilities

- Enabling the business by configuring, supporting, and maintaining Reports and Analytics in Workday
- Creating reports and dashboards for end-users
- Implementing planned projects
- Fielding ad hoc requests in a timely manner
- Understanding customer requirements and ensuring their needs are met
- Fielding feature requests from Workday users
- Setting expectations and communicating timelines

Key Challenges

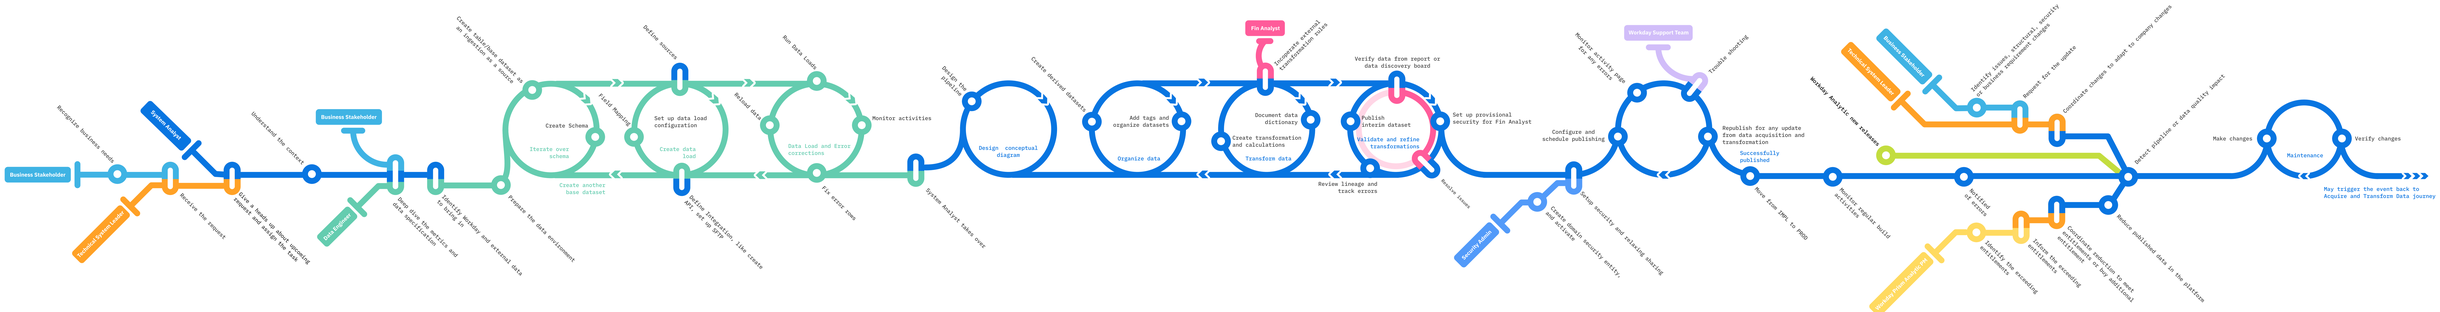
- Needing to understand functional requirements for many different parts of the business
- Team size staying static as demand increases
- Dealing with business changes (e.g. reorgs) and system issues (e.g. failed integrations) can disrupt usual responsibilities
- Understanding and wrangling tools
- Handling the complexity of reconciling and moving data between multiple systems
- Understanding underlying business processes behind data



Phases

KICK OFF		ACQUIRE DATA		PREPARE DATA				OPERATIONALIZE		MAINTAIN PIPELINES	
RECOGNIZE BUSINESS NEEDS	DEEP DIVE REQUIREMENT	LOAD DATA	VALIDATE DATA	DESIGN PIPELINES	CREATE TRANSFORMATIONS	VALIDATE TRANSFORMATIONS	REFINE TRANSFORMATIONS	SET UP SECURITY	PUBLISH	TRACK ENTITLEMENT	MANAGE CHANGES

Actions



Touch Points

- Email
- Ticketing system
- Document and specification
- In-person or virtual meeting

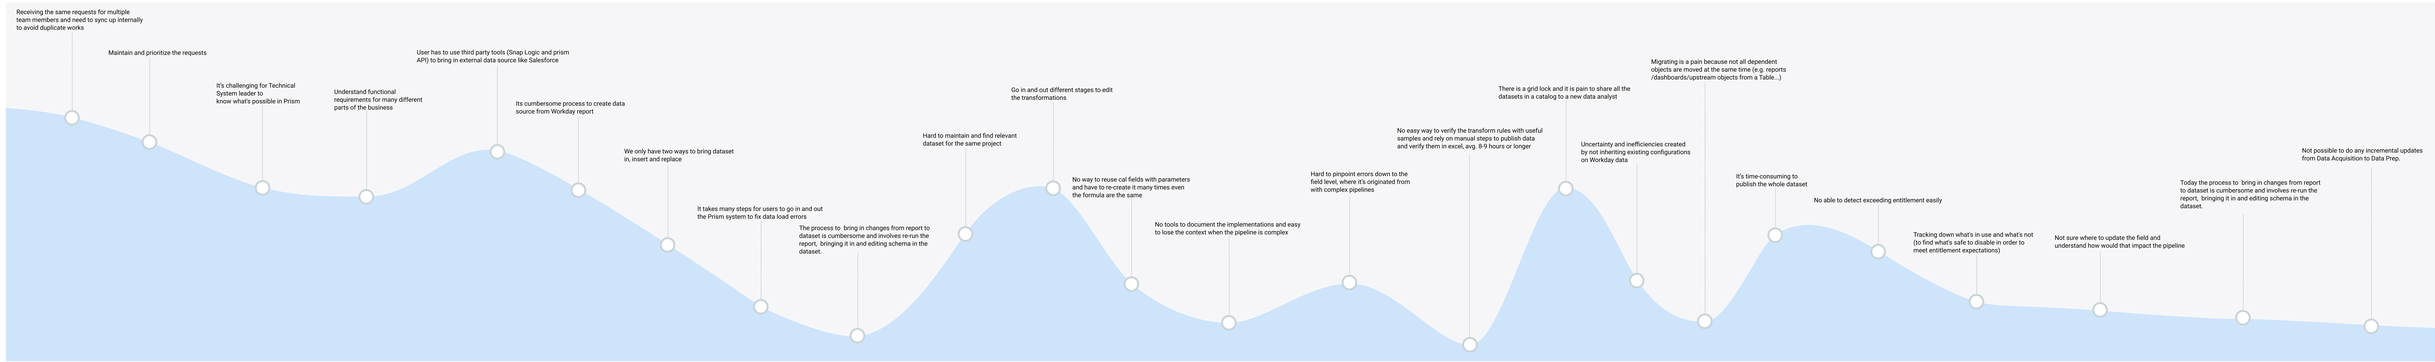
- Workday Report
- .CSV/ Excel
- View Dataset page
- Data Load page
- Activities page

- Flow diagram tool (outside Workday)
- Workday Report
- .CSV/ Excel
- Data Catalog page
- Edit Dataset page
- Data Discovery Board
- View Dataset - Publish tab
- View Lineage page
- Edit Dataset Sharing page
- Ticket system

- Edit Dataset Sharing page
- View Dataset - Publish tab
- Activities page
- Salesforce ticket system, email and phone

- Activities page - Prism Usage tab
- View Dataset - Publish tab
- Email and phone

Emotion Experience



Opportunities

Help integration
- Integrate with Workday Help product to track all the opened request and assign to corrponsonding analyst

Mobile Notification
- The analyst will get notification via mobile when the new request comes in and able to track it from both desktop and mobile

Data Load:
- Data Sync Manager: Integrate cosmos (DER, data extraction report) framework for the data source that can be used to deliver standard reports or dashboards to Prism data catalog. It also enables the capabilities to do incremental sync, full sync and scheduling.

- Provide more capabilities with table data load including delete, update, upsert

- Provide third-party connector to data loads and streamline the process to bring in external data

Monitor Activities:
- Customized notification: automatically notify users if any data loads fail via WD inbox, email integration, slack integration, or mobile notification

Error Handling:
- Provide streamline data correction workflow including finding errors, correcting, and re-running invalid load rows

Data Organization:
- Improve discoverability and usability in Data Catalog including filter on non-column attributes, bulk action, collapsible left nav, metadata enhancements, customize columns, etc.
- Provide folder or project structure to better organize datasets in Data Catalog
- Project lineage: showing lineage across as-yet unlinked data sources, show lineage across multiple pipeline steps (e.g. across data loads to Tables)

Data Transformation:
- A visualization tool, similar to lineage to design pipeline and flow diagram within Prism
- Improve the layout and streamline the workflow
- Provide stage and field description to document the transformations rules and cal fields definitions
- Reusable cal fields
- Table direct query will automatically enable the data source and it will be available for reporting and data disco
- Enhance current import stage experience
- Easy way to identify where cal fields are across different stages, like an indicator

Data Transparency:
- Allow the users to preview their dataset utilizing table data load and data disco without publishing (pipeline to table)
- Provide better samples mechanisms that help users to validate transformation rules

Error Tracking:
- Provide field lineage allowing uses to track any upstream/downstream cal fields updates and errors easily

Publish:
- Parameters in the build pipeline: parameters passed in during publish time
- Rationalized publish process: not having three different experiences (and performance problems) to kick off Publish

Security Inheritance

Orchestration:
- Integrating the Workflow builder UI to show coordination of Data load and build Jobs

Entitlement:
- Improve current entitlement framework

Maintenance:
- Provide the view access capability to data transformation
- Export the dataset definition for the entire pipeline
- Provide field lineage allowing uses to track any upstream/downstream cal fields updates
